

# How to change DNS settings using Control Panel

To change the current DNS settings through the networking settings on Control Panel, use these steps:

1. Open **Control Panel**.
2. Click on **Network and Internet**.
3. Click on **Network and Sharing Center**.
4. Click the **Change adapter settings** option in the left pane.

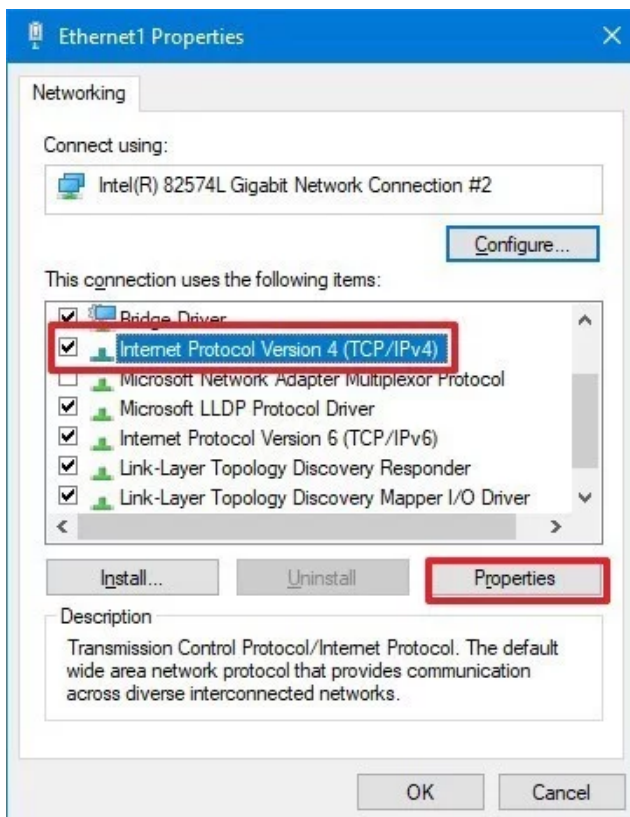

5. Right-click the network interface connected to the internet, and select the **Properties** option.

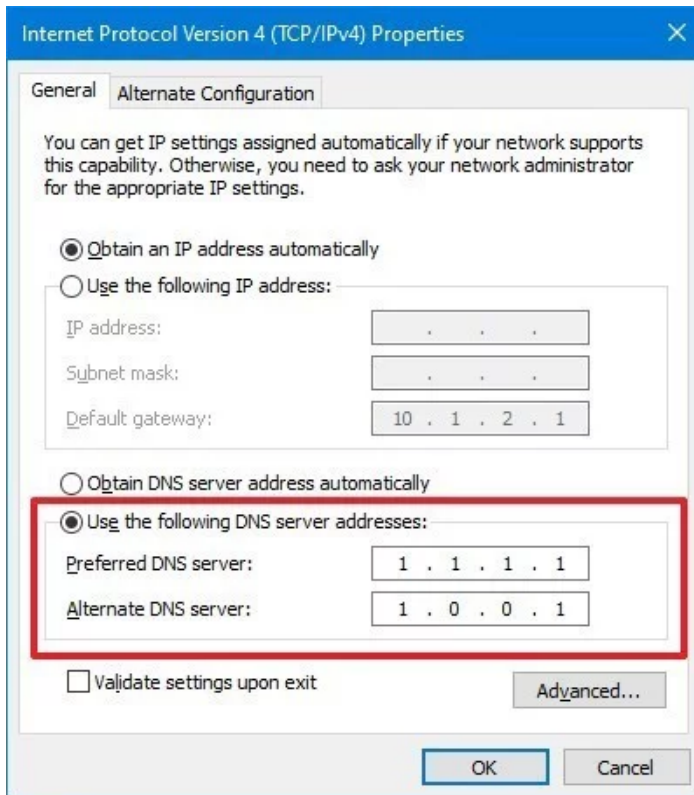

6. Select and check the **Internet Protocol Version 4 (TCP/IPv4)** option.

7. Click the **Properties** button.

8. Click the **Use the following DNS server addresses** option.

9. Type your "preferred" and "alternate" DNS addresses.

If you're using Google Public DNS, OpenDNS, or CloudFlare, you can use these settings:

- **Google Public DNS:** 8.8.8.8 and 8.8.4.4
- **OpenDNS:** 208.67.222.222 and 208.67.220.220
- **Cloudflare:** 1.1.1.1 and 1.0.0.1

**Quick tip:** If you need to use more than two DNS addresses, you can click the **Advanced** button, and on the **DNS** tab, you can add, edit, and remove as many resolvers as you want. You even have an option on the side to set their priority.

10. Click the **OK** button.

11. Click the **Close** button.

Once you complete the steps, your device will immediately start using the DNS settings that you specified.
