

How to change DNS settings using Settings

To change the DNS settings using the Settings app on Windows 10, use these steps:

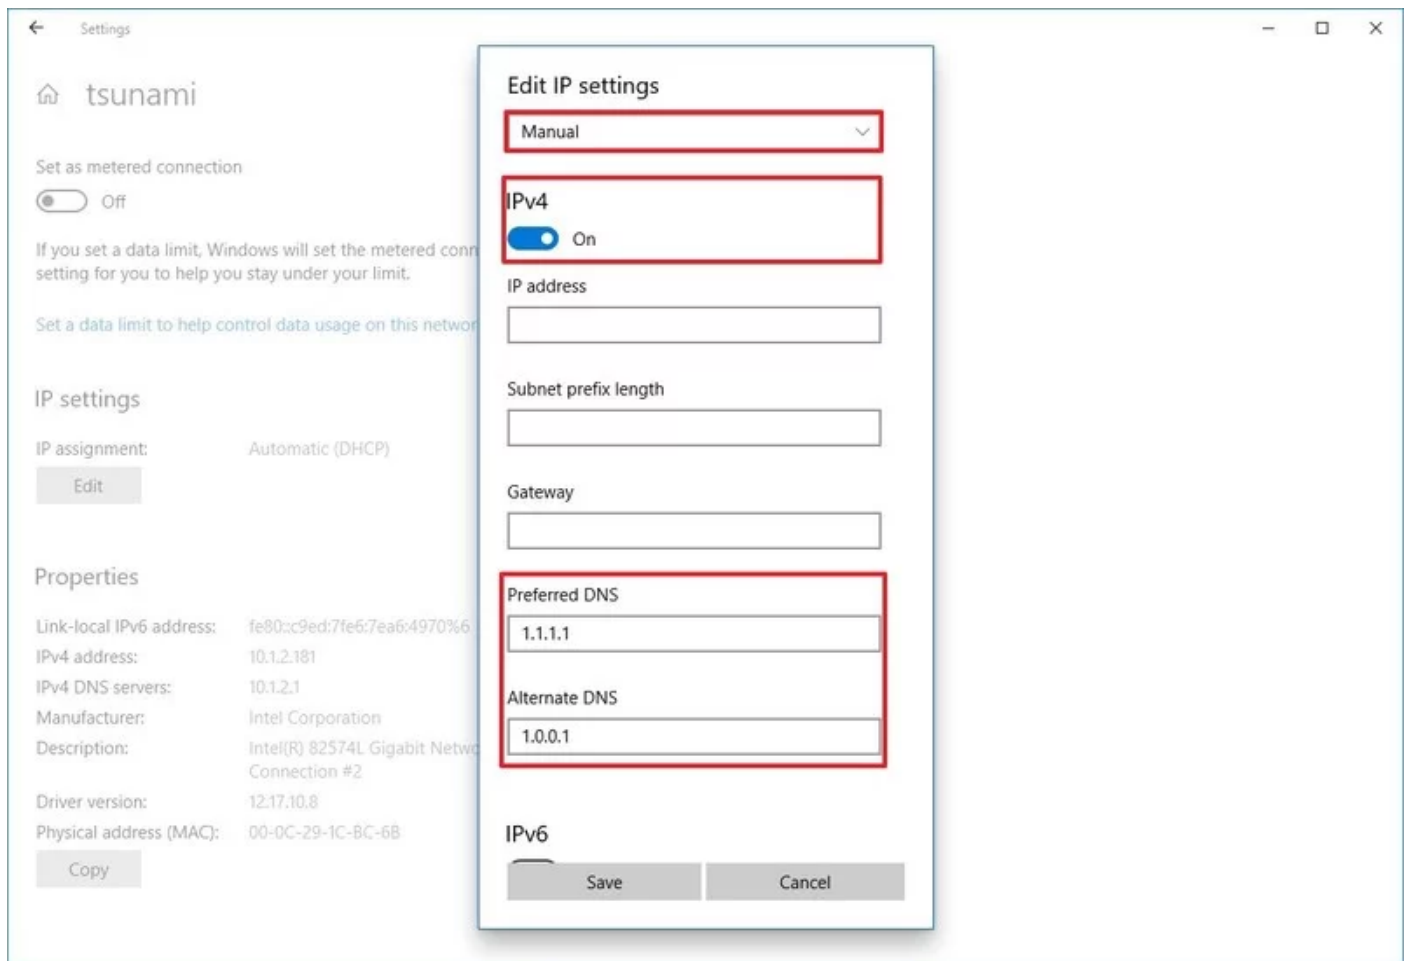

1. Open **Settings**.
2. Click on **Network & Internet**.
3. Click on **Ethernet** (or **Wi-Fi** depending on your connection).
4. Select the network connection.

5. Under the "IP settings" section, click the **Edit** button.

6. Use the "Edit IP settings" drop-down menu and select the **Manual** option.
7. Turn on the **IPv4 toggle** switch.
8. Type your "Preferred DNS" and "Alternate DNS" addresses.

If you're using Google Public DNS, OpenDNS, or CloudFlare, you can use these settings:

- **Google Public DNS:** 8.8.8.8 and 8.8.4.4
- **OpenDNS:** 208.67.222.222 and 208.67.220.220
- **Cloudflare:** 1.1.1.1 and 1.0.0.1

9. Click the **Save** button.

10. Restart your computer.

Once you complete the steps, the new DNS settings will take effect, and you should now be able to connect to the internet using the new resolvers.

Although using the Settings app should be the recommended option to change the DNS settings on your computer, we're listing this option last, because the feature has some design flaws, and it can be confusing for some people. For instance, if you make changes, the new settings will not apply until you restart your computer or renew the TCP/IP lease of your current configuration. Also, using this interface, you can't add more than two DNS addresses.
